## IN THE CLAIMS

Please amend the claims as follows, substituting any amended claim(s) for the corresponding pending claim(s):

1 1. (currently amended) A method for isolating a channel of interest from a set of channels 2 from a plurality of multimedia sources that include a video network and a local media player, in a multimedia system that includes a multimedia server that is coupled to the plurality of 3 4 multimedia sources, wherein at least one of the set of channels includes data from the local 5 media player, the method comprises: 6 receiving the set of channels as a stream of data via a communication path from the 7 multimedia server: 8 interpreting segments of the stream of data to identify data of the channel of interest; interpreting the data of the channel of interest to determine type of the data: 9 10 processing the data of the channel of interest based on the type of data to produce 11 processed data including: 12 when the type of data is video data, converting the data of the channel of interest into at least one of; YUV data and RGB data; and 13 storing the at least one of the YUV data and the RGB data in a frame 14 15 buffer to produce the processed data; and 16 providing the processed data for display. 1 (Original) The method of claim 1 further comprises: receiving the stream of data in packets that include a header portion and a payload 2 3 portion; and 4 interpreting the header portion to determine which of the packets contain the data of the 5 channel of interest.

 (Original) The method of claim 2, wherein the interpreting the data to determine the type of data further comprises:

interpreting at least one of: the header portion and a header section of the payload portion
to determine the type of data.

Docket No. VIXS006

Appl. No. 10/361,463 Response mailed January 2, 2009 Reply to Office Action, mailed date October 2, 2008

- 1 4. (cancelled)
- 1 5. (currently amended) The method of claim 1 claim 4, wherein the providing the processed
- 2 data further comprises:
- 3 retrieving the at least one of the YUV data and the RGB data from the frame buffer at a
- 4 display rate to produce retrieved display data; and
- 5 rendering the retrieved display data for display.
- 1 6. (currently amended) The method of claim 1elaim 4further comprises:
- 2 Huffman decoding the video data to produce Huffman decoded data;
- 3 de-zigzagging the Huffman decoded data to produce de-ZZ data;
- 4 de-quantizing the de-ZZ data to produce de-Q data;
- 5 performing an inverse discrete cosine transform function upon the de-Q data to produce
- 6 IDCT data; and
- 7 performing at least one of motion compensation and scaling upon the IDCT data to
- 8 produce the YUV data.
- (Original) The method of claim 6 further comprises;
- 2 converting the YUV data into the RGB data; and
- 3 storing the at least one of the YUV data and the RGB data.
- 1 8. (Original) The method of claim 3, wherein the processing the data further comprises:
- when the type of data is audio data, converting the data of the channel of interest into
- 3 pulse code modulation (PCM) data; and
- 4 storing the PCM data in a frame buffer to produce the processed data.

- 1 9. (Original) The method of claim 8, wherein the providing the processed data further
- 2 comprises:
- 3 retrieving the PCM data from the frame buffer at a display rate to produce retrieved
- 4 display data; and
- 5 providing the retrieved display data to at least one speaker assembly.
- 1 10. (Original) The method of claim 3, wherein the processing the data further comprises:
- when the type of data is application data, storing the application data in memory to
- 3 produce the processed data.
- 1 11. (Original) The method of claim 10, wherein the providing the processed data further
- 2 comprises:
- 3 retrieving the processed data from memory;
- 4 providing the processed data to a processor;
- 5 generating, by the processor, video data from the processed data; and
- 6 providing the video data to a display.
- 1 12. (Original) The method of claim 1 further comprises:
- 2 receiving the stream of data in frames that include a frame header and a frame payload;
- 3 and
- 4 interpreting the frame header to determine which of the frames contain the data of the
- 5 channel of interest.
- 1 13. (Original) The method of claim 1 further comprises:
- 2 transmitting a channel selection request, wherein the channel selection request identifies
- 3 the channel of interest.
- 1 14. (Original) The method of claim 1, wherein the receiving the stream of data further
- 2 comprises:
- 3 decoding the stream of data to recapture data of a channel of interest.

Appl. No. 10/361,463 Docket No. VIXS006

Response mailed January 2, 2009 Reply to Office Action, mailed date October 2, 2008

1 15. (Original) The method of claim 14, wherein the decoding further comprises at least one

3 multilevel decoding of the stream of data;

4 non return to zero (NRZ) decoding of the stream of data;

5 Manchester decoding of the stream of data;

6 block decoding of the stream of data; and

7 nB/mB decoding of the stream of data, where n < m.

2 16-41. (cancelled)

3 42. (currently amended) An apparatus for isolating a channel of interest from a set of channels from a plurality of media sources including a media network, a local media player and 4 the Internet, in a multimedia system that includes a multimedia server that is coupled to the 5 6 plurality of media sources, the apparatus comprises: 7 processing module; and 8 memory operably coupled to the processing module, wherein the memory includes operational instructions that cause the processing module to: 9 10 receive the set of channels as a stream of data as a stream of data from the multimedia server via a communication path; 11 12 interpret segments of the stream of data to identify data of the channel of interest; 13 interpret the data of the channel of interest to determine type of the data: 14 process the data of the channel of interest based on the type of data to produce processed data including: 15 when the type of data is audio data, converting the data of the channel of 16 17 interest into pulse code modulation (PCM) data; and 18 storing the PCM data in a frame buffer to produce the processed data; and 19 provide the processed data for display. 43 1 (Original) The apparatus of claim 42, wherein the memory further comprises operational 2 instructions that cause the processing module to: 3 receive the stream of data in packets that include a header portion and a payload portion; 4 and interpret the header portion to determine which of the packets contain the data of the 5 6 channel of interest. 1 44. (Original) The apparatus of claim 43, wherein the memory further comprises operational 2 instructions that cause the processing module to interpret the data to determine the type of data 3 by: interpreting at least one of: the header portion and a header section of the payload portion 4 to determine the type of data. 5

Docket No. VIXS006

Appl. No. 10/361,463 Response mailed January 2, 2009 Reply to Office Action, mailed date October 2, 2008

- 1 45. (Original) The apparatus of claim 44, wherein the memory further comprises operational
- 2 instructions that cause the processing module to process the data by:
- 3 when the type of data is video data, converting the data of the channel of interest into at
- 4 least one of: YUV data and RGB data; and
- 5 storing the at least one of the YUV data and the RGB data in a frame buffer to produce
- 6 the processed data.
- 1 46. (Original) The apparatus of claim 45, wherein the memory further comprises operational
- 2 instructions that cause the processing module to provide the processed data by:
- 3 retrieving the at least one of the YUV data and the RGB data from the frame buffer at a
- 4 display rate to produce retrieved display data; and
- 5 rendering the retrieved display data for display.
- 1 47. (Original) The apparatus of claim 45, wherein the memory further comprises operational
- 2 instructions that cause the processing module to:
- 3 Huffman decode the video data to produce Huffman decoded data;
- 4 de-zigzag the Huffman decoded data to produce de-ZZ data;
- 5 de-quantize the de-ZZ data to produce de-Q data;
- 6 perform an inverse discrete cosine transform function upon the de-O data to produce
- 7 IDCT data: and
- 8 perform at least one of motion compensation and scaling upon the IDCT data to produce
- 9 the YUV data.
- 1 48. (Original) The apparatus of claim 47, wherein the memory further comprises operational
- 2 instructions that cause the processing module to:
- 3 convert the YUV data into the RGB data; and
- 4 store the at least one of the YUV data and the RGB data.

Appl. No. 10/361,463 Response mailed January 2, 2009 Reply to Office Action, mailed date October 2, 2008

- 1 49. (cancelled)
- 1 50. (currently amended) The apparatus of <u>claim 42</u>elaim 49, wherein the memory further
- 2 comprises operational instructions that cause the processing module to provide the processed
- 3 data:
- 4 retrieving the PCM data from the frame buffer at a display rate to produce retrieved
- 5 display data; and
- 6 providing the retrieved display data to at least one speaker assembly.
- 1 51. (Original) The apparatus of claim 44, wherein the memory further comprises operational
- 2 instructions that cause the processing module to process the data by:
- 3 when the type of data is application data, storing the application data in memory to
- 4 produce the processed data.
- 1 52. (Original) The apparatus of claim 51, wherein the memory further comprises operational
- 2 instructions that cause the processing module to provide the processed data by:
- 3 retrieving the processed data from memory;
- 4 providing the processed data to a processor;
- 5 generating, by the processor, video data from the processed data; and
- 6 providing the video data to a display.
- 1 53. (Original) The apparatus of claim 42, wherein the memory further comprises operational
- 2 instructions that cause the processing module to:
- 3 receive the stream of data in frames that include a frame header and a frame payload;
- 4 and
- 5 interpret the frame header to determine which of the frames contain the data of the
- 6 channel of interest.
  - 54. (Original) The apparatus of claim 42, wherein the memory further comprises operational
- 2 instructions that cause the processing module to:
- 3 transmit a channel selection request, wherein the channel selection request identifies the
- 4 channel of interest.

Appl. No. 10/361,463 Response mailed January 2, 2009 Reply to Office Action, mailed date October 2, 2008

- 1 55. (Original) The apparatus of claim 42, wherein the memory further comprises operational
- 2 instructions that cause the processing module to receive the stream of data:
- 3 decoding the stream of data to recapture data of a channel of interest.
- 1 56. (Original) The apparatus of claim 55, wherein the memory further comprises operational
- 2 instructions that cause the processing module to decode by at least one of:
- 3 multilevel decoding of the stream of data;
  - non return to zero (NRZ) decoding of the stream of data;
- 5 Manchester decoding of the stream of data;
- 6 block decoding of the stream of data; and
- 7 nB/mB decoding of the stream of data, where n < m.</p>
- 2 57 -74. (cancelled)
